

## DESCRIPTION

## 2,3-DIHYDRO-6-NITROIMIDAZO (2,1-B) OXAZOLE COMPOUNDS FOR THE TREATMENT OF TUBERCULOSIS

## TECHNICAL FIELD

The present invention relates to a 2,3-dihydroimidazo[2,1-b]oxazole compound.

## BACKGROUND ART

5           From among acid-fast bacteria, human Mycobacterium tuberculosis has been widely known. It is said that the one-third of the human population is infected with this bacterium. In addition to the human Mycobacterium tuberculosis, Mycobacterium africanum and  
10 Mycobacterium bovis have also been known to belong to the Mycobacterium tuberculosis group. These bacteria are known as Mycobacteria having a strong pathogenicity to humans.

          Against these tuberculosis, treatment is  
15 carried out using three agents, rifampicin, isoniazid, and ethambutol (or streptomycin) that are regarded as first-line agents, or using four agents such as the above three agents and pyrazinamide.

          However, since the treatment of tuberculosis  
20 requires extremely long-term administration of agents, it might result in poor compliance, and the treatment often ends in failure.

          Moreover, in respect of the above agents, it has been reported that: rifampicin causes hepatopathy,

flu syndrome, drug allergy, and its concomitant administration with other drugs is contraindicated due to P450-associated enzyme induction; that isoniazid causes peripheral nervous system disorder and induces serious hepatopathy when used in combination with rifampicin; that ethambutol brings on failure of eyesight due to optic nerve disorder; that streptomycin brings on diminution of the hearing faculty due to the 8th cranial nerve disorder; and that pyrazinamide causes adverse reactions such a hepatopathy, gouty attack associated with increase of uric acid level, vomiting (A Clinician's Guide To Tuberculosis, Michael D. Iseman 2000 by Lippincott Williams & Wilkins, printed in the USA, ISBN 0-7817-1749-3, Tuberculosis, 2nd edition, Fumiyuki Kuze and Takahide Izumi, Igaku-Shoin Ltd., 1992).

Actually, it has been reported that cases where the standard chemotherapy could not be carried out due to the adverse reactions to these agents made up 70% (approximately 23%, 52 cases) of the total cases where administration of the agents was discontinued (the total 228 hospitalized patients who were subject to the research) (Kekkaku, Vol. 74, 77-82, 1999).

In particular, hepatotoxicity, which is induced by rifampicin, isoniazid, and ethambutol out of the 5 agents used in combination for the aforementioned first-line treatment, is known as an adverse reaction that is developed most frequently. At the same time,

Mycobacterium tuberculosis resistant to antitubercular agents, multi-drug-resistant Mycobacterium tuberculosis, and the like have been increasing, and the presence of these types of Mycobacterium tuberculosis makes the treatment more difficult.

According to the investigation made by WHO (1996 to 1999), the proportion of Mycobacterium tuberculosis that is resistant to any of the existing antitubercular agents to the total types of Mycobacterium tuberculosis that have been isolated over the world reaches 19%, and it has been published that the proportion of multi-drug-resistant Mycobacterium tuberculosis is 5.1%. The number of carriers infected with such multi-drug-resistant Mycobacterium tuberculosis is estimated to be 60,000,000, and concerns are still rising that multi-drug-resistant Mycobacterium tuberculosis will increase in the future (April 2001 as a supplement to the journal Tuberculosis, the "Scientific Blueprint for TB Drug Development.")

In addition, the major cause of death of AIDS patients is tuberculosis. It has been reported that the number of humans suffering from both tuberculosis and HIV reaches 10,700,000 at the time of year 1997 (Global Alliance for TB drug development). Moreover, it is considered that the mixed infection of tuberculosis and HIV has an at least 30 times higher risk of developing tuberculosis than the ordinary

circumstances.

Taking into consideration the aforementioned current situation, the profiles of the desired antitubercular agent is as follows: (1) an agent, which is effective even for multi-drug-resistant Mycobacterium tuberculosis, (2) an agent enabling a short-term chemotherapy, (3) an agent with fewer adverse reactions, (4) an agent showing an efficacy to latent infecting Mycobacterium tuberculosis (i.e., latent Mycobacterium tuberculosis), and (5) an orally administrable agent.

Examples of bacteria known to have a pathogenicity to humans include offending bacteria of recently increasing MAC infection (*Mycobacterium avium-intracellulare* complex infection) such as *Mycobacterium avium* and *Mycobacterium intracellulare*, and atypical acid-fast bacteria such as *Mycobacterium kansasii*, *Mycobacterium marinum*, *Mycobacterium simiae*, *Mycobacterium scrofulaceum*, *Mycobacterium szulgai*, *Mycobacterium xenopi*, *Mycobacterium malmoense*, *Mycobacterium haemophilum*, *Mycobacterium ulcerans*, *Mycobacterium shimoidei*, *Mycobacterium fortuitum*, *Mycobacterium chelonae*, *Mycobacterium smegmatis*, and *Mycobacterium aurum*.

25            Nowadays, there are few therapeutic agents effective for these atypical acid-fast bacterial infections. Under the presence circumstances, antitubercular agents such as rifampicin, isoniazid,

ethambutol, streptomycin and kanamycin, a new quinolone agent that is a therapeutic agent for common bacterial infections, macrolide antibiotics, aminoglycoside antibiotics, and tetracycline antibiotics are used in combination.

However, when compared with the treatment of common bacterial infections, the treatment of atypical acid-fast bacterial infections requires a long-term administration of agents, and there have been reported cases where the infection is changed to an intractable one, finally leading to death. To break the aforementioned current situation, the development of an agent having a stronger efficacy is desired.

For example, National Publication of International Patent Application No. 11-508270 (WO97/01562) discloses that a 6-nitro-1,2,3,4-tetrahydro[2,1-b]-imidazopyran compound has a bactericidal action in vitro to Mycobacterium tuberculosis (H37Rv strain) and multi-drug-resistant Mycobacterium tuberculosis, and that the above compound has a therapeutic effect to a tuberculosis-infected animal model when it is orally administered and thus useful as antitubercular agent.

However, the compound described in the above publication differs from the compound of the present invention in terms of the basic skeleton, and it is considered to be a compound nonsimilar to the inventive compound.

Kuppsuwamy Nagarajan et al. have reported on

European Journal of Medicinal Chemistry, 1989, Vol. 24, pp.631-633 that compounds represented by the following general formula (I):

5 wherein R<sup>1</sup> represents a hydrogen atom or methyl group and -(CH<sub>2</sub>)<sub>n</sub>R<sup>2</sup> represents a chloromethyl group, C1-C7 alkyl group, isopropoxymethyl group, 3-propenyloxy-methyl group, or unsubstituted phenoxy-methyl group, and compounds represented by the same above general formula  
10 (I), wherein R<sup>1</sup> and -(CH<sub>2</sub>)<sub>n</sub>R<sup>2</sup> bind to each other to form a cyclopentane or cyclohexane ring (16 types of compounds in total) have a bactericidal action to Mycobacterium tuberculosis (H37Rv strain).

However, the above publication describes that  
15 only the 4 types of compounds out of the above compounds are effective when they are orally administered. It also describes that the compound having the highest activity, that is, the compound (CGI-17341) represented by the above general formula  
20 (I) wherein R<sup>1</sup> represents a hydrogen atom and -(CH<sub>2</sub>)<sub>n</sub>R<sup>2</sup> represents ethyl, was found to have mutagenicity, and that accordingly, the development of these series of compounds as agents were abandoned.

In addition, Dilip R. Astekar et al. have  
25 reported on Antimicrobial Agents and Chemotherapy, Feb. 1993, pp. 183-186 about the antimicrobial profile of

the above compound CGI-17341. According to the report, the compound CGI-17341 has a bactericidal action to Mycobacterium tuberculosis (H37Rv strain) and multi-drug-resistant Mycobacterium tuberculosis, but it does  
5 not have the activity to atypical acid-fast bacteria, M. avium, M. intracellulare, and M. fortuitum when it is used at 250 µg/ml or less.

Moreover, Journal of Medicinal Chemistry, 1981, Vol. 24, pp. 601-604 discloses that 6-nitro-2,3-  
10 dihydroimidazo[2,1-b]oxazole compounds have a radiosensitizing ability for hypoxic mammalian cells.

The methods for preparing the compounds of the present invention are explained in detail below.

Reaction scheme 1

wherein  $R^1$ ,  $R^2$  and  $n$  are the same as above, and  $X^1$  represents a halogen atom or nitro group.

5 According to reaction scheme 1, the compound of the present invention represented by general formula (1) is produced by reacting a 4-nitroimidazole compound represented by general formula (2) with an epoxy compound represented by general formula (3a) in the presence or absence of a basic compound to obtain a compound represented by general formula (4a), and then  
10 subjecting the obtained compound to a ring closure reaction.

The molar ratio of the compound of general formula (2) to the compound of general formula (3a) may  
15 be generally between 1 : 0.5 and 1 : 5, and preferably between 1 : 0.5 and 1 : 3.

Known compounds can be widely used as a basic compound herein. Examples of such a basic compound  
20 include inorganic basic compounds such as a metal hydride, metal alcoholate, hydroxide, carbonate or

hydrogencarbonate, and organic basic compounds such as acetate.

Specific examples of a metal hydride include sodium hydride and potassium hydride. Specific

10 carbonate. Specific examples of a hydrogencarbonate include sodium hydrogencarbonate and potassium hydrogencarbonate. In addition to the above compounds, sodium amide and the like may also be included in the inorganic basic compounds.

15 Specific examples of acetate include sodium acetate and potassium acetate. In addition to these compounds, specific examples of organic basic compounds include triethylamine, trimethylamine, diisopropyl-ethylamine, pyridine, dimethylaniline, 1-methyl-  
20 pyrrolidine, N-methylmorpholine, 1,5-diazabicyclo[4.3.0]nonene-5(DBN), 1,8-diazabicyclo[5.4.0]undecene-7(DBU), and 1,4-diazabicyclo[2.2.2]octane(DABCO).

The molar ratio of the above basic compound to the compound of general formula (2) may be generally  
25 between 0.1 : 1 and 2 : 1, preferably between 0.1 : 1 and 1 : 1, and more preferably between 0.1 : 1 and 0.5 : 1.

The reaction of the compound of general

formula (2) with the compound of general formula (3a) is generally carried out in an appropriate solvent.

Common solvents can be widely used as the above solvent, as long as it does not inhibit the  
5 reaction. Examples of such a solvent include aprotic polar solvents such as dimethylformamide (DMF), dimethylsulfoxide (DMSO) or acetonitrile, ketone solvents such as acetone or methylethylketone, hydrocarbon solvents such as benzene, toluene, xylene,  
10 tetralin or liquid paraffin, alcohol solvents such as methanol, ethanol, isopropanol, n-butanol or tert-butanol, ether solvents such as tetrahydrofuran (THF), dioxane, dipropyl ether, diethyl ether or diglyme, ester solvents such as ethyl acetate or methyl acetate,  
15 and mixed solvents thereof. Water may be contained in these solvents.

The reaction of the compound of general formula (2) with the compound of general formula (3a) is carried out, for example, as follows: The compound  
20 of general formula (2) is dissolved in a reaction solvent, and while stirring, a basic compound is added to the mixture cooled on ice or at up to room temperature (30°C). Thereafter, the mixture is stirred at room temperature to 80°C for 30 minutes to 1 hour, and  
25 the compound of general formula (3a) is then added thereto. Thereafter, the mixture is further stirred generally at room temperature to 100°C, and preferably 50°C to 80°C, generally for 30 minutes to 60 hours, and

560

preferably for 1 to 50 hours.

The compound (2) used as a starting material is known. The compound (3a) includes a novel compound, and a method for producing the compound will be explained later.

The compound of the present invention represented by general formula (1) is produced by subjecting the compound represented by general formula (4a) to a ring closure reaction. The ring closure reaction is carried out by dissolving the above obtained compound represented by general formula (4a) in a reaction solvent and then adding a basic compound thereto followed by stirring.

Herein, as a reaction solvent and a basic compound, there can be used the same reaction solvent and the same basic compound as used in the above reaction of the compound of general formula (2) with the compound of general formula (3a).

The molar ratio of the basic compound to the compound of general formula (4a) is generally equal to 1 : 1 or higher, preferably between 1 : 1 and 5 : 1, and more preferably between 1 : 1 and 2 : 1.

The reaction temperature for the ring closure reaction is generally 0°C to 150°C, preferably room temperature to 120°C, and more preferably 50°C to 100°C. The reaction time is generally 30 minutes to 48 hours, preferably 1 to 24 hours, and more preferably 1 to 12 hours.

In the present invention, the reaction mixture can be directly subjected to the following ring closure reaction without isolating the compound of general formula (4a) generated as a result of the reaction of the compound of general formula (2) with the compound of general formula (3a). For example, the compound of general formula (2) is reacted with the compound of general formula (3a) at room temperature to 80°C, and thereafter, a basic compound is added to the obtained reaction mixture followed by stirring at 50°C to 100°C. Otherwise, after the compound of general formula (2) is reacted with the compound of general formula (3a) at room temperature to 80°C, the obtained reaction mixture is concentrated, and the residue is dissolved in a high boiling solvent. Thereafter, a basic compound is added to the obtained solution followed by stirring at 50°C to 100°C, so as to produce a compound of interest represented by general formula (1).

Alternatively, in the reaction of the compound of general formula (2) with the compound of general formula (3a), a basic compound is used at a molar ratio of the basic compound to the compound (2) that is between 0.9 : 1 and 2 : 1. The stirring is carried out at 50°C to 100°C, so that the reaction of the compound of general formula (2) with the compound of general formula (3a) is carried out in a single process to produce a compound of interest represented

562

by general formula (1).

Reaction scheme 2

wherein X<sup>1</sup> is the same as above, R<sup>1A</sup> represents a hydrogen atom or a C1-6 alkyl group and R<sup>2A</sup> represents a group of (a) to (y) as defined above.

5 According to reaction scheme 2, the compound of the present invention represented by general formula (1w) is produced by reacting a compound represented by general formula (3b) with a compound represented by general formula (5) or a salt thereof, so as to obtain  
10 a compound represented by general formula (4c), and then subjecting the obtained compound represented by general formula (4c) to a ring closure reaction, in the presence of a basic compound.

The compound (3b) is novel, and a method for  
15 producing the compound will be explained later (reaction scheme 6). Further, the compound (5) includes a novel compound. An example of methods for producing the above compound will be described later in Reference Example 2.

20 The molar ratio of the compound of general formula (3b) to the compound of general formula (5) may

563

be generally between 1 : 0.5 and 1 : 5, and preferably between 1 : 0.5 and 1 : 2.

The reaction of the compound of general formula (3b) with the compound of general formula (5) is carried out in the presence of a basic compound in an appropriate solvent.

As a basic compound and a reaction solvent, there can be used the same basic compound and the same reaction solvent as used in the above reaction of the compound of general formula (2) with the compound of general formula (3a). The molar ratio of the basic compound to the compound of general formula (3b) is generally a catalytic amount, preferably between 0.1 : 1 and 3 : 1, and more preferably between 0.1 : 1 and 2 : 1.

The salt of the compound (5) can be used instead of using the compound (5) and a basic compound. Examples of such a salt include alkali metal salts such as a sodium salt or a potassium salt of the compound (5).

The reaction of the compound of general formula (3b) with the compound of general formula (5) is carried out, generally at room temperature to 150°C, preferably at room temperature to 120°C, and more preferably at room temperature to 80°C. The reaction time is generally 10 minutes to 48 hours, preferably 10 minutes to 24 hours, and more preferably 10 minutes to 2 hours.

The compound of the present invention represented by general formula (1w) is produced by subjecting the compound represented by general formula (4c) to a ring closure reaction. The ring closure  
5 reaction is carried out by dissolving the above obtained compound represented by general formula (4c) in a reaction solvent and then adding a basic compound thereto followed by stirring at a certain temperature.

Herein, as a reaction solvent and a basic  
10 compound, there can be used the same reaction solvent and the same basic compound as used in the above reaction of the compound of general formula (3b) with the compound of general formula (5).

The molar ratio of the basic compound to the  
15 compound of general formula (4c) is generally equal to 1 : 1 or higher, preferably between 1 : 1 and 5 : 1, and more preferably between 1 : 1 and 2 : 1.

The reaction temperature for the ring closure reaction is generally 0°C to 150°C, preferably room  
20 temperature to 120°C, and more preferably 50°C to 100°C. The reaction time is generally 10 minutes to 48 hours, preferably 10 minutes to 24 hours, and more preferably 20 minutes to 4 hours.

In the present invention, the reaction

Next, a medical preparation containing the compound of the present invention as an active ingredient will be explained.

25 The above medical preparation is obtained by preparing the compound of the present invention in the form of a common medical preparation. It is prepared using commonly used diluents or excipients such as a

624

filler, expander, binder, wetting agent, disintegrator, surfactant or lubricant.

Such a medical preparation can be selected from among various forms, depending on therapeutic  
5 purposes. Typical examples of a preparation form include a tablet, pill, powder, liquid, suspension, emulsion, granule, capsule, suppository, and injection (liquid, suspension, etc.)

Known carriers can be widely used in making  
10 the medical preparation in a tablet form. Examples of such a carrier include excipients such as lactose, sucrose, sodium chloride, glucose, urea, starch, calcium carbonate, kaoline or crystalline cellulose; binders such as water, ethanol, propanol, simple syrup,  
15 glucose solution, starch solution, gelatin solution, carboxymethylcellulose, shellac, methylcellulose, potassium phosphate or polyvinylpyrrolidone; disintegrators such as dry starch, sodium alginate, agar powder, laminaran powder, sodium  
20 hydrogencarbonate, calcium carbonate, polyoxyethylene sorbitan fatty acid esters, sodium lauryl sulfate, monoglyceride stearate, starch or lactose; disintegration controllers such as sucrose, stearin, cacao butter or hydrogenated oil; absorption enhancers  
25 such as quaternary ammonium base or sodium lauryl sulfate, humectants such as glycerin or starch, adsorbents such as starch, lactose, kaoline, bentonite or colloidal silica, and lubricants such as purified

625

talc, stearate, boric acid powder or polyethylene glycol.

Moreover, such tablets can be prepared as tablets with common tablet coating, such as a sugar  
5 coated tablet, gelatin coated tablet, enteric coated tablet, film coated tablet, double coated tablet, or multi-coated tablet.

Known carriers can be widely used in making the medical preparation in a pill form. Examples of  
10 such a carrier include excipients such as glucose, lactose, starch, cacao butter, hydrogenated vegetable oil, kaoline or talc, binders such as gum arabic powder, tragacanth powder, gelatin or ethanol, and disintegrators such as laminaran or agar.

15 Known carriers can be widely used in making the medical preparation in a suppository form. Examples of such a carrier include polyethylene glycol, cacao butter, higher alcohol, higher alcohol esters, gelatin, and semisynthetic glyceride.

20 In a case where the medical preparation is prepared as an injection such as a liquid, emulsion or suspension, these solutions are preferably sterilized and prepared to be isotonic to blood. Known diluents can be widely used in making the medical preparation in  
25 such a liquid, emulsion or suspension form. Examples of such a diluent include water, ethanol, propylene glycol, ethoxylated isostearyl alcohol, polyoxylated isostearyl alcohol, and polyoxyethylene sorbitan fatty

acid esters. Moreover, in the case of using the medical preparation as an injection, a certain amount of common salts, glucose or glycerin that is sufficient to prepare an isotonic solution may be added to the  
5 medical preparation. Otherwise, a common solubilizing agent, buffer, soothing agent or the like may also be added to the medical preparation. Further, a coloring agent, preservative, perfume, flavor, sweetening agent or other pharmaceuticals may also be added thereto, if  
10 necessary.

The amount of the compound of the present invention contained in the medical preparation is not particularly limited, but it can be appropriately selected from a wide range. Generally, 1 to 70% by  
15 weight of the compound of the present invention is preferably contained in the medical preparation.

The method of administering the medical preparation of the present invention is not particularly limited. It is administered depending on  
20 various preparation forms, patients' age, sex, conditions of disease, or other conditions. For example, where the medical preparation adopts a tablet, pill, liquid, suspension, emulsion, granule or capsule form, it is administered orally. In the case of an  
25 injection, it can be administered intravenously, singly or in combination with a common auxiliary fluid such as glucose or amino acid. Moreover, if necessary, it can be singly administered intramuscularly, intradermally,

subcutaneously or intraperitoneally. In the case of a suppository, it can be administered intrarectally.

The dose of the above medical preparation may be appropriately selected depending on usage, patients' age, sex, level of disease, or other conditions. Generally 0.01 to 100 mg, preferably 0.1 to 50 mg per kg of body weight of the medical preparation is administered once or divided into several times per day.

Since the above dose is altered depending on various conditions, the dose smaller than the above range may be sufficient in some cases, or the dose greater than the above range may be required in other cases.

The compound of the present invention has a specific effect against *Mycobacterium tuberculosis* such as acid-fast bacteria (*Mycobacterium*, atypical acid-fast bacteria). The compound of the present invention has an excellent effect against multi-drug-resistant *Mycobacterium tuberculosis*. The compound of the present invention has an antimicrobial action against anaerobic bacteria.

The compound of the present invention does not only show the above described activities in vitro, but it also expresses the above activities in oral administration.

The compound of the present invention does not induce diarrhea, which is induced by known

628

antimicrobial agents having a wide spectrum for common bacteria such as Gram-positive bacteria or Gram-negative bacteria. In addition, it has lesser adverse reactions than existing agents. Accordingly, it can be  
5 a medical preparation, which can be administered for a long time.

The compound of the present invention can be distributed well in the tissues of the lung, the main organ that is infected by acid-fast bacteria, and it  
10 has properties such as sustained efficacy or excellent safety. Accordingly, a high therapeutic effect can be expected from the compound.

When compared with existing antitubercular agents, the compound of the present invention shows a  
15 strong bactericidal action even towards cytozoic bacteria such as *Mycobacterium tuberculosis* present in a human macrophage. Accordingly, it enables a reduction of reoccurrence rate of tuberculosis and the realization of a short-term chemotherapy. It is  
20 therefore expected that the compound of the present invention will also be used as a main preventive agent administered for a mixed infection by HIV and tuberculosis, which is considered to be a serious problem.

## Example 1

Preparation of (R)-2-methyl-6-nitro-2-(2-(4-(4-trifluoromethoxybenzyl)-piperazine-1-yl)benzothiazole-6-yloxymethyl)-2,3-dihydroimidazo[2, 1-b]oxazole

5 (R)-2-Chloro-1-(2-methyl-2-oxyranylmethyl)-4-nitro-1H-imidazole (51 mg, 0.23 mmol) and 6-hydroxy-2-(4-(4-trifluoromethoxybenzyl)-piperazine-1-yl)-benzothiazole (80 mg, 0.20 mmol) were dissolved in DMF (5 ml). To this mixture, sodium hydride (10 mg, 0.25  
10 mmol) was added and stirred at 60°C for 1.5 hours. After allowing to stand at room temperature, water was added to the reaction solution and extracted with ethyl acetate. The combined organic layer was washed with water and saturated brine, then dried over magnesium  
15 sulfate. This was filtered and then the filtrate was concentrated under reduced pressure. The residue was purified by silica gel column chromatography (n-hexane: ethyl acetate = 1:3 → ethyl acetate) and recrystallized from ethanol to afford (R)-2-methyl-6-nitro-2-(2-(4-(4-  
20 trifluoromethoxybenzyl)-piperazine-1-yl)benzothiazole-6-yloxymethyl)-2,3-dihydroimidazo[2, 1-b]oxazole (40 mg, yield 33%) as colorless powdered crystals.

Melting point: 205.6-207.4°C.

## Example 2

25 Preparation of (R)-2-methyl-6-nitro-2-(2-(4-(4-trifluoromethoxyphenoxy)piperidine-1-yl)pyridine-5-oxy)methyl-2,3-dihydro-imidazo[2, 1-b]oxazole

5-hydroxy-2-(4-(4-trifluoromethoxy)-

phenoxy)piperadine-1-yl)pyridine (0.67 g, 1.9 mmol) and (R)-2-chloro-1-(2-methyl-2-oxyranylmethyl)-4-nitro-1H-imidazole (0.51 g, 2.4 mmol) were dissolved in DMF (6.7 ml). To this mixture, sodium hydride (91 mg, 2.3 mmol) was added and stirred at 50-55°C for 1 hour. Water was added to the reaction solution and extracted with methylene chloride. The organic layer was washed with saturated brine, dried over magnesium sulfate and then filtered under suction. The resulting filtrate was concentrated under reduced pressure. The residue was purified by silica gel column chromatography (methylene chloride/ethyl acetate = 10/0, 9/1, 8/2), and further crystallized from methylene chloride/diisopropyl ether/ethyl acetate to afford (R)-2-methyl-6-nitro-2-(2-(4-(4-trifluoromethoxyphenoxy)piperidine-1-yl)pyridine-5-oxy)methyl-2,3-dihydro-imidazo[2, 1-b]oxazole (0.30 g, yield 29%) as a light yellow powder.

## Example 1463

(R)-2-(4-(4-(4-chlorophenyl)oxazol-2-yl)phenoxyethyl)-  
2-methyl-6-nitro-2,3-dihydroimidazo[2,1-b]oxazole

1.73 g (7.9 mmol) of (R)-2-chloro-1-(2-  
5 methyl-2-oxyranylmethyl)-4-nitro-1H-imidazole, 1.80 g  
(6.6 mmol) of 4-(4-(4-chlorophenyl)oxazol-2-yl)phenol,  
and 0.42 g (2.0 mmol) of potassium phosphate were  
suspended in 15 ml of ethanol, and the mixture was  
heated under reflux with stirring for 3 hours in an  
10 argon atmosphere. The reaction solution was  
concentrated, and dichloromethane was then added to the  
residue to precipitate non-soluble product, which was  
then filtered off. The filtrate was concentrated, and  
the residue was dissolved in 20 ml of DMF to give a  
15 solution. 0.29 g (7.3 mmol) of 60% sodium hydride was  
added to the solution while cooled by ice, and the  
obtained mixture was stirred for 6 hours. Thereafter,  
the solvent was removed under a reduced pressure, and  
100 ml of acetone and 10 ml of silica gel were added to  
20 the residue, followed by concentration. The residue  
was purified by silica gel column chromatography  
(dichloromethane : methanol = 50 : 1 to 30 : 1), and  
the resultant product was crystallized from a mixed  
solvent consisting of dichloromethane and ethanol. The  
25 resultant product was then recrystallized from a mixed  
solvent consisting of acetone and water to obtain 1.15  
g (yield: 38%) of light brown powders, (R)-2-(4-(4-(4-

The resultant product was recrystallized from ethanol to obtain 0.57 g (yield: 36%) of light yellow powdery crystals, 6-((R)-2-methyl-6-nitro-2,3-dihydroimidazo[2,1-b]oxazol-2-ylmethoxy)-2-(4-(4-trifluoromethoxybenzyl)piperidin-1-yl)quinoline. ## Test example 1

Antibacterial test (agar-plate dilution method)

10 The minimum inhibitory concentration of 2,3-dihydro-6-nitroimidazo[2,1-b]oxazole obtained in Sample 129 against M. tuberculosis H37Rv in 7H11 medium (BBL Co.) was determined. A bacterial suspension of the strain used was prepared beforehand by culturing the  
15 bacteria in 7H9 medium (BBL Co.) followed by calculation of the viable cell count and cryopreservation at -80°C. The final viable cell count of the preparation was approximately  $10^6$  CFU/ml. A 5-μL portion of the bacterial suspension was added to 7H11  
20 agar medium containing the test compound, cultured at 37°C for 14 days, and then tested to measure the minimum inhibitory concentration.

The minimal inhibitory concentration against M. tuberculosis H37Rv was 0.0015 μg/mL.
